Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Epoxy-Coated Rebar competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Epoxy-Coated Rebar is a type of steel reinforcement bar that has been coated with a thin layer of epoxy to protect it from corrosion. This specialized rebar is primarily used in concrete structures exposed to harsh environments, such as marine applications, bridge decks, parking garages, and highways where chloride-induced corrosion from de-icing salts is a major concern. The epoxy coating acts as a barrier, preventing moisture and chlorides from reaching the steel surface, thereby significantly extending the life of the concrete structure. Typically, epoxy-coated rebar conforms to standards such as ASTM A775/A775M or A996/A996M, which regulate coating thickness, adhesion, flexibility, and other critical properties. While it offers improved corrosion resistance compared to black steel rebar, proper handling and installation are essential, as damage to the coating can compromise its effectiveness. Despite the emergence of alternative corrosion-resistant reinforcements, such as stainless steel or galvanized rebar, epoxy-coated rebar remains a cost-effective and widely used solution for infrastructure durability. In 2024, the global shipment of epoxy-coated rebar exceeded 2.7 million metric tons, with an average market price of \$1,050 per ton.

The global Epoxy-Coated Rebar market size was estimated at USD 2845.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
