The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Epoxy Die Bonding Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A silver paste die bonder is a machine used in the Epoxy Die Bonding process. Epoxy Die Bonding, also known as "silver paste die bonding", employs a silver paste made of a mixture of epoxy resin and silver particles. The epoxy resin serves as the matrix, providing adhesive strength and mechanical stability to firmly attach the chip to the substrate. The silver particles endow the silver paste with excellent electrical and thermal conductivity, which is crucial for the high-performance of semiconductor devices. In the process, the silver paste is first coated on the substrate surface, then the chip is placed on the silver paste, and through a curing process such as heating, the epoxy resin undergoes a cross-linking reaction and hardens, firmly fixing the chip on the substrate. This process not only achieves the mechanical fixation of the chip but also provides electrical connection and heat conduction through the silver paste. Due to the use of silver paste as the core material, this process is called "silver paste die bonding". Silver paste meets the requirements for conductivity, thermal conductivity, and mechanical strength of semiconductor devices, making this process widely used in high-reliability and high-performance applications such as automotive electronics, aerospace, and medical equipment. In summary, a silver paste die bonder is an essential tool in semiconductor packaging that uses silver paste to fix chips on substrates, providing comprehensive performance for semiconductor devices.
