Abstracts

Epoxy encapsulant materials are thermosetting polymers used to protect sensitive electronic components from environmental stresses such as moisture, chemicals, mechanical shock, and thermal cycling by forming a durable, insulating barrier around them. These materials are typically formulated with epoxy resins, hardeners, fillers like silica for thermal conductivity or flame retardancy, and additives to enhance flow, adhesion, or curing properties, and they are applied in liquid form before hardening into a solid, protective shell through heat or UV curing processes. Their key characteristics include high electrical insulation, excellent adhesion to various substrates, low shrinkage during curing, and resistance to temperature extremes, making them indispensable in electronics manufacturing for applications ranging from microchips and sensors to power modules and LEDs.

The global Epoxy Encapsulant Material market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
