Abstracts

Epoxy intumescent coatings are reactive, solvent-based or solvent-free fire protection systems applied to structural steel and other substrates, which, when exposed to heat, undergo a controlled chemical expansion to form a thick, insulating char layer that delays temperature rise and maintains structural integrity during a fire. These coatings consist of epoxy resins as the binder, combined with intumescent agents such as ammonium polyphosphate, expandable graphite, and other synergists, and are characterized by their durability, adhesion, corrosion resistance, and ability to provide both passive fire protection and anti-corrosive properties in demanding environments such as industrial facilities, offshore platforms, and commercial construction.

The global Epoxy Intumescent Coating market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
