Report Overview

Eptacog alfa (recombinant factor VIIa, rFVIIa) is a genetically engineered version of human coagulation factor VIIa, used to control bleeding episodes in patients with hemophilia A or B with inhibitors, congenital factor VII deficiency, or Glanzmann's thrombasthenia. It works by binding to tissue factor at the site of vascular injury, activating the extrinsic coagulation pathway and promoting localized clot formation. Marketed under brands like NovoSeven, it is administered intravenously and serves as a critical therapeutic option for patients resistant to standard clotting factor replacement. The high cost of rFVIIa and its off-label use in trauma and surgical bleeding have also influenced its market dynamics, though regulatory scrutiny and competition from extended half-life products pose challenges. The market is driven by increasing hemophilia prevalence, advancements in recombinant protein production, and demand for effective bypassing agents, while cost constraints and emerging gene therapies present long-term competitive pressures.

The global Eptacog Alfa rFVIIa market size was estimated at USD 1365.19 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
