Report Overview

The magnetic separator is a screening device used to remove iron powder and other materials from reused granular materials. After the ore slurry flows into the trough through the ore feeding box, the ore particles enter the ore feeding area of the trough in a loose state under the action of the water flow from the ore spray pipe. Under the action of a magnetic field, magnetic ore particles are magnetically aggregated to form a 'magnetic group' or 'magnetic chain'. The 'magnetic group' or 'magnetic chain' is subjected to a magnetic force in the slurry, moves toward the magnetic pole, and is adsorbed on the cylinder. Because the polarities of the magnetic poles are alternately arranged along the direction of rotation of the cylinder, and are fixed during work, the 'magnetic group' or 'magnetic chain' is magnetically stirred due to the alternation of the magnetic poles when the cylinder rotates and is mixed. Non-magnetic minerals such as gangue in 'magnetic clusters' or 'magnetic chains' fall off during turning, and the 'magnetic clusters' or 'magnetic lotus' that are finally absorbed on the surface of the cylinder are concentrates. Magnetic separator equipment includes drums, belts, rollers and eddy current separators. Widely used in resource recycling, wood, mining, kiln, chemical, food and other workshops, suitable for wet magnetic separation of magnetite, pyrrhotite, roasting ore, ilmenite and other materials with a particle size of 3mm or less. It is one of the most widely used and highly versatile machines in the industry to remove iron from coal, non-metallic ore, and building materials.
