Report Overview:

Erbium-doped fiber amplifier is a kind of fiber amplifier, which adds erbium ions to the fiber core. It is characterized by high gain and low noise, independent of polarization and can amplify optical signals in 1.55 m or 1.58 m bands. It used to be necessary to use optical repeaters to convert attenuated arrival time into electrical signals, which amplify and regenerate the waveform, then convert back to light and resend it. Erbium-doped fiber amplifier (ERFA), one of the greatest inventions in optical fiber communication, was first developed by The University of Southampton in 1985. Secondly, erbium-doped fiber is a fiber doped with a small amount of erbium (Er) ions in quartz fiber, which is the core of erbium-doped fiber amplifier. Since the late 1980s, the research of erbium-doped fiber amplifier has made great breakthroughs. WDM technology greatly increases the capacity of optical fiber communication and has become the most widely used optical amplifiers in optical fiber communication.

The Global Erbium Doped Fiber Amplifier Market Size was estimated at USD 780.82 million in 2023 and is projected to reach USD 1266.85 million by 2029, exhibiting a CAGR of 8.40% during the forecast period.
