## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ergonomic Dental Stool competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Ergonomic Dental Stool production reached approximately 4,750 k units with an average global market price of around US\$ 260 per unit, and a gross profit margin of approximately 15%-30%. An ergonomic dental stool is a purpose-designed operator or assistant seating system used in dental operatories to support healthy posture, stable mobility, and efficient access to the patient during prolonged clinical procedures. Unlike generic clinical or office seating, an ergonomic dental stool is engineered around the specific biomechanical demands of dentistry: forward-leaning work, frequent micro-position changes, close access to the oral cavity, and repeated reaching within a tight ergonomic zone. Key design features typically include contoured or saddle-style seats that encourage anterior pelvic tilt, adjustable lumbar or torso support, multi-function levers for height/tilt/backrest positioning, and stable five-caster bases that balance mobility with anti-tip safety. Many modern models are offered in dedicated operator and assistant versions, the latter often integrating armrest/torso supports and foot rings to maintain a neutral shoulder and hip position during elevated seating.

The global Ergonomic Dental Stool market size was estimated at USD 1235.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
