Report Overview:

EPP is a rare genetic disease. Due to the defect of heme biosynthesis, excessive protoporphyrin IX (PPIX) is accumulated and stored in the blood and tissues of patients. When exposed to visible light and near visible ultraviolet radiation, PPIX is activated by light, causing photosensitive damage to surrounding tissues and causing unbearable pain. The disease is a skin photophobia. The patient cannot see the light. After being exposed to sunlight or artificial light, the patient will experience serious biochemical reactions, resulting in skin burns, ulcers and phototoxicity.
