## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on ES Fiber for Sanitary Products competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of ES fiber for sanitary materials will reach 525,000 tons, with an average selling price of US\$1,459.86 per ton. The sheath of ES fiber offers a low melting point and excellent softness, while the core has a high melting point and high strength. After opening and blending, ES fibers are formed into a lightweight, uniform web. After the web is formed, it enters the drying process, where hot air from the drying equipment penetrates the web, thermally bonding it to form the nonwoven fabric. Air-through nonwoven fabrics offer bulk, excellent elasticity, a soft touch, strong thermal insulation, and excellent breathability and permeability. They are widely used in the manufacture of uniquely stylish disposable products such as baby diapers, adult incontinence pants, and feminine hygiene products. Japan was the first country to adopt ES fiber as a nonwoven covering material for disposable hygiene products. ES fiber is also widely used in industrial fields such as food packaging, decorative materials, and filtration materials. ES fiber for sanitary products (sheath-core composite polyester fiber) is a core raw material used in high-end sanitary products such as diapers and sanitary napkins.

The global ES Fiber for Sanitary Products market size was estimated at USD 766.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
