Abstracts

eSIM is a technology that digitizes a physical SIM card. It is pre-embedded in devices such as smartphones, tablets, and smartwatches, and can be programmed remotely. This allows users to freely switch between telecommunication companies' services while still using the device at hand. eSIMs offer great convenience for users who need roaming and multiple communication providers, and their application range is very broad, as they can also be used for IoT devices. eSIM is an electronic SIM card, a data file that can be downloaded to a mobile terminal through the Internet. With it, various electronic products can connect to the Internet, make and receive calls, send text messages, etc. Functionally, it is the same as an ordinary SIM card. Any device that can access a mobile network can use eSIM. Of course, the premise is that the device hardware supports eSIM. The eSIM solution integrated in the hardware currently takes up only 1/3 of the space of a Nano SIM card, and will evolve to a smaller size in the future.
