Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on eSIM Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An eSIM chip (embedded SIM) is a small, rewritable integrated circuit built directly into a device's motherboard that performs the same subscriber identity and authentication functions as a traditional SIM card, but without the need for a removable physical card. It uses a standardized, programmable architecture that allows mobile network profiles to be remotely downloaded, activated, or switched via software, enabling users to change carriers or plans without swapping hardware. eSIM chips are widely used in smartphones, tablets, wearables, IoT devices, and automotive systems, offering advantages such as space savings, improved durability, enhanced security, and easier global connectivity management. In 2024, the shipment volume of eSIM Chips will be about 500 million pieces, with an average price of US\$2 per piece.

The global eSIM Chip market size was estimated at USD 965.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global eSIM Chip market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
