Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on eSIM System-on-Chip (SoC) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An eSIM System-on-Chip (SoC) is an integrated semiconductor solution that embeds the functions of an eSIM (embedded SIM) directly into a single chip along with other core components, such as cellular connectivity modules, security elements, and sometimes application processors. Unlike traditional removable SIM cards or even discrete eSIM chips, an eSIM SoC consolidates identity management, encryption, and network authentication into the device's main hardware architecture, reducing space, power consumption, and cost. This makes it particularly valuable for IoT devices, wearables, automotive systems, and compact consumer electronics, where miniaturization, robust security, and remote SIM provisioning are essential. In 2024, the shipment volume of eSIM System-on-Chip will be about 500 million pieces, with an average price of US\$2 per piece.

The global eSIM System-on-Chip (SoC) market size was estimated at USD 965.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global eSIM System-on-Chip (SoC) market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
