Abstracts

Esketamine nasal spray is a pharmaceutical product approved for the treatment of treatment-resistant depression (TRD) and major depressive disorder (MDD) with acute suicidal ideation or behavior in adults. As the S-enantiomer of ketamine, it functions as a non-competitive N-methyl-D-aspartate (NMDA) receptor antagonist, offering a novel mechanism of action distinct from traditional antidepressants such as SSRIs or SNRIs. Administered intranasally under medical supervision due to its potential for dissociation, abuse, and sedation, it provides rapid-onset antidepressant effects?often within hours?compared to the weeks typically required for conventional treatments. Its approval marked a significant advancement in neuropsychiatry, addressing unmet needs in severe, refractory depression populations.

The global Esketamine Nasal Spray market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
