Abstracts

An esophageal stethoscope is a specialized medical device used for continuous auscultation of heart and breath sounds during general anesthesia and critical care settings, consisting of a soft, flexible tube with a balloon-covered distal tip that is inserted into the patient's esophagus and connected to a standard or electronic stethoscope earpiece; it provides real-time, high-quality acoustic monitoring of cardiopulmonary function, reduces ambient noise interference compared to external stethoscopes, and is particularly valuable in surgeries where patient positioning or draping limits external access, though its use has declined in some regions due to the growing adoption of more advanced multiparameter monitors offering integrated capnography, pulse oximetry, and electronic auscultation.

The global Esophageal Stethoscopes market size was estimated at USD 39.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
