Report Overview

Estriol is a naturally occurring estrogen hormone, primarily produced during pregnancy by the placenta, and is one of the three major endogenous estrogens, alongside estradiol and estrone. It is considered a weaker estrogen compared to estradiol but plays a crucial role in maintaining reproductive health, particularly in pregnancy, by supporting uterine growth and fetal development. Estriol is also used therapeutically, particularly in hormone replacement therapy (HRT) for menopausal symptoms, as its milder estrogenic activity may reduce risks associated with stronger estrogens, such as increased cancer or cardiovascular risks. Additionally, it is utilized in some topical formulations for vaginal atrophy and has been studied for potential applications in autoimmune conditions like multiple sclerosis. The market for estriol is influenced by factors such as the growing demand for bioidentical hormone therapies, increasing awareness of menopausal health, and ongoing research into its broader therapeutic applications. Regulatory approvals, patent expirations, and competition from synthetic hormone alternatives also shape its commercial landscape.

The global Estriol market size was estimated at USD 3.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.91% during the forecast period.
