Abstracts

Etching end-point monitors are specialized devices or systems used in semiconductor manufacturing to detect the precise moment when an etching process should be stopped. These monitors track changes in parameters such as optical emissions, mass spectrometry signals, or electrical properties to determine when the desired material layer has been fully etched without over-etching into underlying layers. By providing real-time feedback, etching end-point monitors help improve process accuracy, yield, and consistency in the fabrication of microelectronic components.

The global Etching End-point Monitors market size was estimated at USD 864.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
