Report Overview

Etching frames are specialized components used in the semiconductor and electronics manufacturing industries, primarily for holding silicon wafers or other substrates during photolithography and etching processes. These frames ensure precise alignment and stability while substrates undergo chemical or plasma etching to create intricate circuit patterns. Typically made from durable materials like stainless steel or aluminum with corrosion-resistant coatings, etching frames must maintain high dimensional accuracy and cleanliness to prevent contamination or defects in microfabrication. Their design varies based on wafer size (e.g., 200mm, 300mm) and process requirements, with some incorporating automated handling features for advanced production lines. The performance of etching frames directly impacts yield rates in chip manufacturing, making them critical for maintaining consistency in high-volume semiconductor production.
