### Report Overview

An ethylene cracking furnace, also known as an ethane cracking furnace, is a specialized industrial furnace used in the petrochemical industry to produce ethylene through the process of thermal cracking. It is a key component of an ethylene production plant. The furnace operates at extremely high temperatures (typically around 850-950°C) to break down hydrocarbon feedstocks, such as ethane or naphtha, into lighter hydrocarbon molecules, primarily ethylene. The cracking process involves the thermal decomposition of larger hydrocarbon molecules into smaller, more valuable molecules, including ethylene and other byproducts. The ethylene cracking furnace consists of a radiant section where the feedstock is heated by direct exposure to burners, and a convection section where heat is transferred to the feedstock through convection tubes. The furnace's design ensures efficient heat transfer and optimal cracking conditions. Ethylene cracking furnaces play a critical role in the production of ethylene.

The global Ethylene Cracking Furnace market size was estimated at USD 1645.20 million in 2023 and is projected to reach USD 2899.78 million by 2032, exhibiting a CAGR of 6.50% during the forecast period.
