Abstracts

Ethylene glycol diformate is a chemical compound primarily used as a feed additive in the livestock and poultry industries, where it acts as an acidifier and preservative to improve feed hygiene, enhance nutrient digestibility, and inhibit the growth of harmful microorganisms such as Salmonella and E. coli. It is synthesized through the esterification of ethylene glycol with formic acid, resulting in a clear, colorless liquid with antimicrobial properties that make it effective in supporting animal gut health and overall productivity. The compound is valued for its stability, ease of handling, and ability to release formic acid gradually in the digestive system, contributing to its role as a functional alternative to antibiotic growth promoters, especially in regions with stringent regulations on antimicrobial use in animal feed.

The global Ethylene Glycol Diformate market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
