Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ethylene-octene Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ethylene-octene copolymers are a type of linear low-density polyethylene (LLDPE) or polyolefin elastomer (POE) produced through the copolymerization of ethylene and 1-octene (an alpha-olefin comonomer). These copolymers are typically synthesized using metallocene or Ziegler-Natta catalysts, which allow for precise control over molecular architecture and comonomer distribution. The incorporation of octene into the polymer chain introduces short-chain branching, which enhances flexibility, impact resistance, clarity, and low-temperature toughness. Ethylene-octene copolymers are widely used in flexible packaging films, automotive parts, footwear, adhesives, wire & cable insulation, and molded goods, owing to their excellent balance of strength and elasticity, high optical clarity, and good compatibility with other polyolefins.

The global Ethylene-octene Copolymers market size was estimated at USD 1584.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
