Abstracts

Ethylene-vinyl acetate (EVA), also known as poly (ethylene-vinyl acetate) (PEVA), is the copolymer of ethylene and vinyl acetate. The weight percent vinyl acetate usually varies from 10 to 40%, with the remainder being ethylene. Compared to plasticized PVC, EVA has long lasting properties and the usage of EVA reduces the sealing temperature. This in turn, reduces the fabrication time for flexible sheets and films, increases the efficiency, and reduces the production costs for industries. Moreover, EVA copolymers can also withstand increased amounts of filler loading without serious changes in their physical properties. Additionally, EVA copolymers also have larger ozone resistance, and exhibit lesser thermal stability under increased load and lacks resilience.

The global Ethylene Vinyl Acetate market size was estimated at USD 7661.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
