Abstracts

Ethylethanolamine (EEOA) is an organic chemical compound belonging to the class of amino alcohols, specifically a secondary amine with the molecular formula $C_4H_{11}NO$, characterized by the presence of both an amine group and a hydroxyl group in its structure, which imparts properties such as water solubility, alkalinity, and reactivity, making it a versatile intermediate widely used in the synthesis of surfactants, corrosion inhibitors, textile chemicals, agrochemicals, and pharmaceutical products, where it functions as a building block for further chemical modifications due to its ability to undergo reactions typical of both amines and alcohols. The global market for ethylethanolamine is primarily driven by demand from end-use industries such as agrochemicals, where it serves as a key raw material in herbicide formulations, personal care and cosmetics for surfactant production, textiles for finishing agents, and oil and gas for corrosion inhibitors, with significant regional consumption observed in Asia-Pacific due to expanding industrial manufacturing, particularly in China and India, followed by North America and Europe where stricter environmental regulations influence product specifications and application development. Market growth is tempered by factors such as price volatility of raw materials like ethylene oxide and ammonia, health and environmental concerns regarding chemical handling, and competition from alternative amines or bio-based substitutes, though ongoing research into niche applications including gas treatment and pharmaceuticals offers potential avenues for expansion, with production concentrated among a limited number of global chemical manufacturers who focus on capacity expansions and technological innovations to enhance product purity and application efficiency.

The global Ethylethanolamine (EeoA) market size was estimated at USD 280.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
