Abstracts

EUV light source is the core component of EUV lithography machine and is also used in EUV mask inspection equipment. EUV light source refers to extreme ultraviolet light with a wavelength of 10 to 14 nanometers, and the specific commonly used wavelength is 13.5 nanometers. The EUV (extreme ultraviolet) light source system consists of three core units: light generation, light collection, and spectrum purification and homogenization. The key components of the system include high-performance CO₂ lasers as light sources, multi-layer coated mirrors, load devices, high-efficiency light collectors, precision masks, and projection optical systems (using Xe or Sn to form plasma). In this process, the plasma effectively purifies the energy spectrum through the multiple reflection mechanism of the multi-layer film mirror, and finally produces EUV light with a wavelength of 13.5nm. The mainstream EUV light source suppliers are mainly Cymer, Gigaphoton, etc. Ushio's EUV light source is used in Lasertec's ACTIS mask defect detection equipment. In the semiconductor lithography process, corresponding light sources are required for different masks. The applications of different masks vary greatly, and can be generally divided into binary masks, phase-shift masks, and EUV masks. EUV masks are new masks designed specifically for EUV (extreme ultraviolet) lithography technology. In view of the extremely short wavelength of EUV and its easy absorption by a variety of materials, traditional refractive elements such as lenses cannot be used. Instead, according to the Bragg law, the reflection of the light beam is achieved through a multi-layer (ML) structure (unlike EUV, DUV uses transmitted light). EUV is mainly used in 7nm, 5nm, 3nm and 2nm (TSMC plans to mass produce in 2025) high-end manufacturing processes.

The global EUV Light Sources market size was estimated at USD 215.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
