Report Overview

Poor battery heat dissipation can reduce battery charge rate, which in turn increases charging time, and can even damage temperature-sensitive batteries. The thermal design of the power lithium battery pack of an electric vehicle is a key technology to ensure the reliable operation of the battery, and how to export the heat of the battery cell is a core design consideration. Air cooling and liquid cooling in common battery thermal management, these two cooling methods first transfer heat from the battery system to the cooling pipe through heat conduction, and then transfer the heat to the air through the cooling pipe. In order to achieve the best heat dissipation effect of the cooling pipe, it is necessary to fill the interface material with high thermal conductivity between the cooling pipe and the battery, so as to exclude air, reduce the heat transfer resistance, and significantly improve the heat dissipation effect.
