## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on EVA Cell Freezing Bags competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. EVA cell freezing bag is a cryopreservation container made from medical-grade ethylene-vinyl acetate multilayer film, designed for freezing, storing and transporting cells, tissues and biologics in liquid-nitrogen environments. EVA offers low-temperature toughness, flexibility and puncture resistance. These bags feature welded ports, aseptic tubing interfaces and compatibility with closed-system transfers, sterile packaging and batch traceability. Available in research and clinical GMP grades, they support controlled-rate freezing, automated filling workflows and downstream processing in cell therapy manufacturing and regulatory documentation support. In 2024, global production of EVA Cell Freezing Bags reached 17.99 million units, with an average selling price of \$28.6 per unit. This product typically has a single-line production capacity of approximately 200 to 500 k units per year, with an industry gross profit margin of approximately 25%–35%. The cost structure consists of direct materials accounting for 40%–50%, manufacturing overhead accounting for 20%–30%, direct labor accounting for 8%–12%, and R&D and registration amortization accounting for 10%–20%. The upstream suppliers of this product are pharmaceutical-grade PVA film (with high technical barriers and strong bargaining power), piping, valves, and other suppliers. The downstream suppliers include cell therapy CDMOs, hospital hematology departments/cell therapy centers, and research institutes.

The global EVA Cell Freezing Bags market size was estimated at USD 515.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
