### Report Overview

Preparation of film layers in vacuum, including deposition of crystalline metal, semiconductor, insulator, and other elemental or compound films. Although chemical vapor deposition also uses vacuum methods such as reduced pressure, low pressure, or plasma, vacuum coating generally refers to the deposition of thin films using physical methods. There are three forms of vacuum coating, namely evaporation coating, sputtering coating, and ion plating. Evaporative coating is a technology that uses resistance or Electron-beam furnace coating materials under vacuum conditions to evaporate its atoms or molecules from the surface and deposit them on the substrate surface to form films. This technology has the characteristics of wide application range, highly controllable film thickness, mature technology, low cost, etc
