Report Overview

Evaporative aromatherapy diffusers are devices used to disperse the aroma of essential oils into the air through the process of evaporation. These diffusers work by allowing the essential oils to naturally volatilize and release their fragrance into the surrounding environment. The basic design of evaporative aromatherapy diffusers typically includes a reservoir or compartment for holding the essential oils and a medium through which the oils can evaporate. The medium can be a porous material like a pad, a clay stone, or even a piece of wood. The essential oils are applied or soaked onto the medium, and as air passes over it, the oils slowly evaporate and fill the space with their aroma.
