Abstracts

The Evaporative Cooling Unit in a Machine Room is a specialized cooling system designed to remove heat generated by machinery and equipment in a confined space. It utilizes the principle of evaporative cooling, where water absorbs heat as it evaporates, resulting in a drop in temperature. The cooling unit typically consists of a water distribution system, evaporative pads or panels, and a fan. As the fan draws in outside air, it passes through the wet pads, causing water to evaporate and cool the air. This chilled air is then circulated within the machine room, effectively lowering the temperature and maintaining an optimal environment for equipment operation.

The global Evaporative Cooling Unit In Machine Room market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
