Report Overview:

Event stream processing (ESP) platforms are software systems that perform real-time or near-real-time calculations on event data "in motion." The input is one or more event streams containing data about customer orders, insurance claims, bank deposits/withdrawals, tweets, Facebook postings, emails, financial or other markets, or sensor data from physical assets such as vehicles, mobile devices or machines. The platforms process the input data as it arrives (hence "in motion"), before optionally storing it in some persistent store. They retain a relatively small working set of stream data in memory, just long enough to perform calculations on a set of recent data for the duration of a time window.

The Global Event Stream Processing Market Size was estimated at USD 801.07 million in 2023 and is projected to reach USD 2065.43 million by 2029, exhibiting a CAGR of 17.10% during the forecast period.
