Report Overview:

Excimer lamps, also known as ultraviolet excimer lamps, use excimer gas ratios to obtain high-intensity ultraviolet light of different monochromatic wavelengths, such as 172nm, 222nm, or 308nm. The ultraviolet light emitted by excimers has a single-spectrum characteristic, and the narrow spectral lines and monochromatic ultraviolet radiation spectrum make it possible to use more concentrated power for photoprocessing.

Compared with traditional mercury ultraviolet lamps, excimer ultraviolet lamps are super powerful, precise targeting, free from mercury hazards, environmentally friendly, recyclable, and free from secondary pollution. The characteristics of reaction area and short reaction time have been widely used in microelectronics, medicine, material science, and environmental protection.

The Global Excimer Lamps Market Size was estimated at USD 131.71 million in 2023 and is projected to reach USD 183.68 million by 2029, exhibiting a CAGR of 5.70% during the forecast period.
