Report Overview

The exhaust flexible joint is a flexible pipe connected to the engine exhaust system. It is usually located between the exhaust pipe and the muffler, used to connect the two parts and provide a certain degree of flexibility. The main function of the exhaust flexible joint is to reduce vibration and noise in the exhaust system and allow for relative movement between the engine and the exhaust system. Due to the vibration and thermal expansion generated by the engine during operation, the exhaust flexible joint can absorb and reduce the impact of these vibrations and thermal expansion on the exhaust system through its flexible design and materials. Exhaust flexible joints are usually made of stainless steel or iron materials and have characteristics of high temperature resistance and corrosion resistance. Its structure generally consists of an inner corrugated pipe, an outer mesh sleeve, and flange connections at both ends. The inner corrugated pipe has a certain degree of flexibility, which can stretch and twist during engine vibration and thermal expansion, while the outer mesh sleeve serves as protection and reinforcement.
