## Abstracts

Exhaust Gas Recirculation (EGR) valve is a component in an internal combustion engine that controls the flow of exhaust gases recirculated back into the engine's intake system. The purpose of the EGR valve is to lower combustion temperatures, thereby reducing the formation of nitrogen oxides (NOx), which are harmful pollutants. The valve works by directing a portion of the exhaust gases back into the intake manifold, where they mix with incoming air and reduce the oxygen content, preventing excessively high combustion temperatures. EGR valves can be mechanically or electronically controlled, with modern vehicles often using electronically controlled valves for more precise and efficient operation.

The global Exhaust Gas Recirculation Egr Valve market size was estimated at USD 1133.51 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
