Abstracts

Exosome purification services use specialized techniques to isolate and purify exosomes from biological samples such as blood, urine, cell culture fluid, and tissue homogenates. The core goal is to remove impurities (such as other cellular debris, free proteins, nucleic acids, and lipid particles) from the sample to obtain highly pure, highly active, and biologically functional exosomes to meet subsequent research or application needs. Traditional ultracentrifugation methods suffer from low yield, poor purity, and time-consuming processes. However, in recent years, new technologies such as microfluidics, immunoaffinity capture, and size-exclusion chromatography have emerged. These technologies enable more efficient isolation and purification of exosomes, improving purity and yield, and driving the development of the exosome purification service industry. Exosome purification services were initially primarily used in basic research, but with increasing research, their applications have become increasingly widespread in clinical diagnostics, drug development, and medical aesthetics. For example, research on exosomes as drug delivery vehicles continues to advance, and exosome-based liquid biopsy kits are increasingly common, creating new market opportunities for exosome purification services. North America and Europe took the lead in exosome research and application early on, resulting in relatively mature markets. The Asia-Pacific market, on the other hand, is experiencing rapid growth, with markets in countries and regions such as China, Japan, and South Korea continuing to expand. These regions are expected to become significant growth areas in the global exosome purification service market.

The global Exosome Purification Service market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.20% during the forecast period.
