Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Exothermic Cutters competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Exothermic Cutters production reached approximately 229.3 K units, with an average global market price of around US\$ 750 per unit. Exothermic cutters are tools that use the high temperatures generated by exothermic reactions to cut various materials. They typically use oxygen as a combustion aid and a steel rod or similar fuel. An ignition device ignites the flame, causing a violent oxidation reaction between the rod and oxygen. This generates a significant amount of heat, creating a high-temperature flame that can reach temperatures of 8,000 degrees Fahrenheit (approximately 4,427 degrees Celsius) or higher. This melts the metal or other material and blows it away from the cutting surface, achieving the desired effect. Upstream raw material steel is the primary source for the structural components, blades, and key transmission parts of exothermic cutters. Industrial gases, including oxygen, propane, and acetylene, are essential auxiliary raw materials in the exothermic cutting process. High-purity oxygen, as a combustion-supporting gas, directly impacts the efficiency and cross-section quality of flame cutting. Electronic components are the core components driving the intelligent operation of CNC exothermic cutting systems, including PLC controllers, servo motors, human-machine interfaces, sensors, and power modules. Midstream is comprised of exothermic cutter manufacturers, who process upstream raw materials into various types of exothermic cutters. They possess advantages in technology research and development and product quality. Downstream, they are widely used in metalworking, concrete demolition, brick cutting, and other fields. They also play a vital role in building renovation and demolition, factory maintenance, salvage operations, waste disposal, and mining. They are also used in firefighting and rescue operations,

such as removing pins from heavy equipment.

The global Exothermic Cutters market size was estimated at USD 172.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
