Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Expandable Lumbar Interbody System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Expandable Lumbar Interbody System is a medical device used in spinal fusion procedures to treat conditions such as degenerative disc disease, spondylolisthesis, and spinal deformities in the lumbar (lower back) region. Designed to be inserted into the intervertebral disc space, the system expands once in place to restore disc height, realign the spine, and provide a stable environment for bone fusion. Unlike static cages, expandable systems allow for in situ height and angle adjustment, improving anatomical fit and minimizing the need for excessive distraction during surgery. These systems are often used in minimally invasive approaches and are made from biocompatible materials such as titanium or PEEK to support long-term integration and fusion.

The global Expandable Lumbar Interbody System market size was estimated at USD 288.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
