Abstracts

Expansive cement can generate volume expansion in the hydration process, and it does not shrink but also expand to some extent. The major components of expansive cement include: silicate-type, aluminate-type, sulphoaluminate-type and calcium aluminoferrite-type. The expansion mechanism is the expansion of ettringite generated in cement paste. And the setting and hardening of silicate expansive cement is relatively slow; but that of the aluminate one is fast. According to the Japan Cement Association, Japan's cement industry emitted about 40 million tons of carbon dioxide in 2020. And the cement industry became the fourth largest source of carbon dioxide emissions in the industrial sector after electricity, steel and chemicals. 60% of the cement industry's carbon emissions come from process emissions, 35% from combustion emissions and 5% from indirect emissions from electricity. According to our ?Building Materials Research Institute?, the global clinker capacity in 2022 was about 3.55 billion tons, and the global cement production was about 4.0 billion tons. According to the National Bureau of Statistics, China's cumulative cement output reached 2.118 billion tons in 2022.

The global Expansive Cement market size was estimated at USD 5475.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
