Abstracts

The market for experimental animal models encompasses the breeding, supply, and utilization of genetically, physiologically, or pharmacologically modified animals?such as rodents, zebrafish, and non-human primates?that are employed in biomedical, pharmaceutical, and academic research to study disease mechanisms, test therapeutic efficacy, and evaluate toxicity. This market is driven by advancements in genetic engineering, including CRISPR and transgenic technologies, which enable the creation of highly specific and humanized models that better mimic human conditions, thereby improving the predictive value of preclinical studies. Key end-users include pharmaceutical and biotechnology companies, contract research organizations (CROs), and academic institutions, with demand heavily influenced by R&D investment levels, regulatory requirements for animal testing, and the ongoing development of personalized medicine approaches. Ethical considerations and the rise of alternative methods, such as in vitro and in silico models, present both challenges and opportunities for innovation within the sector, though animal models remain integral to translational research due to their biological complexity and systemic insights.

The global Experimental Animal Model market size was estimated at USD 2430.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
