## Abstracts

An explosion-proof low-voltage alternator is a power generation device specially designed for use in environments with explosion hazards. It has an explosion-proof function, which is achieved through special structural designs, material selections, and manufacturing processes to prevent factors such as electric sparks and high temperatures generated inside the alternator from spreading to the surrounding hazardous environment. It outputs low voltage, generally within the low-voltage range specified by relevant standards (usually referring to an alternating current voltage of 1000V or less and a direct current voltage of 1500V or less). It can meet the power requirements of specific places such as underground coal mines, petrochemical workshops, and flammable and explosive warehouses, providing safe and reliable power supply for lighting and the operation of small equipment in these places.

The global Explosion-Proof Low-voltage Alternator market size was estimated at USD 465.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
