Abstracts

External bonded post-tensioning systems involve steel tendons placed outside the concrete structure, typically along beams or slabs. These tendons are anchored at the ends and tensioned using hydraulic jacks after the concrete has hardened. Once the tendons are stretched, they are bonded to the concrete using grout or other materials, creating a permanent bond that enhances the structure's strength. This system is often used in bridge construction, parking structures, and retrofitting applications, where it is essential to increase load capacity or address structural deficiencies. External bonded post-tensioning provides high durability and can be adjusted for maintenance or performance improvements over time.

The global External Bonded Post-Tensioning Systems market size was estimated at USD 302.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
