Abstracts

External Hex Implants are dental implant systems characterized by an external hexagonal connection at the top of the implant fixture, serving as the interface between the implant and the abutment or prosthetic components. The external hex allows for straightforward indexing of prosthetic components, facilitating ease of restoration. However, one limitation is that the external hex connection is more susceptible to micro-movements under occlusal forces, which can lead to screw loosening or even implant failure over time. Despite this, external hex implants have a long track record of clinical success and remain widely used, especially in cases where compatibility with existing prosthetic components is essential.

The global External Hex Implant market size was estimated at USD 2417.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global External Hex Implant market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
