Abstracts

External post-tensioning systems involve the use of steel tendons placed outside the concrete structure, typically along the surface of beams, slabs, or other elements. These tendons are anchored at the ends of the structure and tensioned using hydraulic jacks after the concrete has set. The applied force compresses the concrete, enhancing its strength and durability. External post-tensioning is often used in bridges, parking structures, and retrofitting existing buildings. It allows for easier adjustments and maintenance compared to internal systems and can be employed to correct deficiencies or improve performance in aging or overburdened concrete structures.

The global External Post-Tensioning Systems market size was estimated at USD 327.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
