Abstracts

An extra fast recovery diode is a specialized semiconductor device engineered to minimize reverse recovery time?the critical interval required for the diode to switch from conducting to blocking state?significantly faster than standard recovery diodes, typically achieving recovery times in the range of tens to hundreds of nanoseconds. These components are essential in high-frequency switching applications, such as switch-mode power supplies (SMPS), inverters, motor drives, and power factor correction circuits, where rapid switching reduces energy losses, electromagnetic interference (EMI), and heat generation, thereby enhancing overall system efficiency and reliability. Characterized by low reverse recovery charge (Qrr) and soft recovery properties, extra fast recovery diodes are often constructed using advanced semiconductor materials and epitaxial processes to optimize performance in demanding environments.

The global Extra Fast Recovery Diode market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
