Report Overview

The term 'extremity' is generally used to refer to a person's limbs and related parts. Upper extremities include the shoulders, hands, elbows, forearms, wrists, and fingers. Lower extremities consist of the feet, toes, ankles, knees, shins, and thighs. The extremity products are used to treat, repair, replace, or heal extremity injuries such as fractures or damage. These products include external recovery braces, surgical implants, joint replacements, biologics, and external support implants.

The upper extremities segment accounted for major shares in the extremities market due to the high prevalence of orthopedic disorders in the shoulders. This segment focuses on injuries in shoulder, wrist, and hand, among others. Shoulder injuries contribute majorly as the bones in shoulder are integral for the movement of the arm. Age and sports make extensive use of shoulder muscles and bones that increase occurrences of shoulder injuries.
