Abstracts

Fabry disease therapeutics comprise a range of pharmacological treatments designed to address the underlying cause or manage the symptoms of Fabry disease, a rare X-linked lysosomal storage disorder resulting from deficient activity of the enzyme alpha-galactosidase A, leading to the accumulation of globotriaosylceramide (Gb3) and related lipids in cells throughout the body. The market includes enzyme replacement therapies (ERTs), such as agalsidase alfa and agalsidase beta, which provide exogenous enzyme to facilitate substrate breakdown, as well as newer pharmacological chaperone therapies like migalastat, which stabilize mutant enzyme forms to enhance their function. The market is characterized by high treatment costs, specialized distribution channels, and a strong focus on lifelong management, with ongoing research into gene therapies and next-generation treatments aiming to improve efficacy, reduce infusion burdens, and address unmet needs in specific patient subgroups.

The global Fabry Disease Therapeutic market size was estimated at USD 1724.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
