Abstracts

A face checkpoint scanner is a biometric security device that utilizes facial recognition technology to authenticate or verify individuals at designated access points, typically in high-security environments such as airports, corporate buildings, data centers, or critical infrastructure facilities. These systems capture and analyze unique facial features?such as the distance between eyes, jawline shape, and nose structure?by comparing live or recorded images against a pre-enrolled database, enabling real-time identification, access control, or surveillance with minimal human intervention. Advanced models may integrate liveness detection to prevent spoofing, support integration with existing security infrastructure, and comply with privacy and data protection regulations, offering a balance between security efficiency and user convenience.
