### Report Overview

Vision sensors, not to be confused with the digital sensors found within cameras, are a type of machine vision solution meant to perform simple presence/absence checks and provide pass/fail inspections in unstructured situations. The ability of a camera to take images is combined with the processing capacity of a computer to output results regarding the location, quality, and completeness of a produced part or product. Unlike other types of sensors, including fiber optic and ultrasonic sensors, vision sensors can handle multiple inspection points per target. Vision sensors can also detect products or packages by pattern, feature, and color. Vision sensors are widely used throughout industrial plants and industrial processes, to maintain the quality of products and to check that operational efficiency is being achieved. Barcodes, blot/stain detection, sizing and alignment, and many other characteristics can be determined without any contact taking place. Vision sensors lack the most sophisticated vision tools available on standalone machine vision systems but can perform a great number of vision tasks in factory automation and logistics environments. Vision sensors are also more affordable than machine vision systems and require less expertise to run.

The global Factory Automation Vision Sensors market size was estimated at USD 2425 million in 2023 and is projected to reach USD 7633.59 million by 2030, exhibiting a CAGR of 17.80% during the forecast period.

North America Factory Automation Vision Sensors market size was USD 631.89 million in 2023, at a CAGR of 15.26% during the forecast period of 2024 through 2030.
