Report Overview

Fan convectors operate effectively at system water temperatures as low as 35°C. A standard domestic radiator is essentially designed to operate at much higher temperatures, around 70°C, and while it is theoretically possible to run them at lower temperatures, their performance and heat output is dramatically reduced and their physical size is substantially increased. To operate close to their optimum efficiency, heat pumps should be paired with modern fan convectors to minimise on running costs and carbon emissions.
