Report Overview:

Far-field speech recognition is an essential technology for speech interactions, and aims to enable smart devices to recognize distant human speech (usually 1m-10m). This technology is applied to many scenarios such as smart home appliances (smart loudspeaker, smart TV), meeting transcription, and onboard navigation. Microphone array is often used to collect speech signals for far-field speech recognition. However, in a real environment, there is a lot of background noise, multipath reflection, reverberation, and even human voice interference, leading to decreased quality of pickup signal. Generally, the accuracy of far-field speech recognition is significantly less than near-field speech recognition.

The Global Far-field Speech Recognition Market Size was estimated at USD 2078.74 million in 2023 and is projected to reach USD 5611.66 million by 2029, exhibiting a CAGR of 18.00% during the forecast period.
