Abstracts

Farm animal internal dewormers are medications or products used to eliminate or control internal parasites in farm animals, such as cattle, sheep, goats, pigs, and poultry. These dewormers are typically administered orally or through feed to target parasites that reside in the gastrointestinal tract or other internal organs of the animals. Anthelmintics are the most commonly used dewormers for farm animals. They are designed to kill and control internal worms, such as roundworms, tapeworms, whipworms, and hookworms. Anthelmintics often come in oral formulations, such as drenches or powders, which can be administered to the animals directly or mixed with their feed. Benzimidazoles are a class of anthelmintic drugs commonly used in farm animal deworming. They work by disrupting the metabolism and energy production of internal parasites. Dewormers like albendazole and fenbendazole are examples of benzimidazoles used to eliminate internal parasites in farm animals. Some dewormers may contain a combination of active ingredients to target multiple types of internal parasites simultaneously. These combination dewormers can provide comprehensive protection against various parasites and may be more convenient for farmers to administer.
